

# EXPLORANDO LA SEGURIDAD Y ORQUESTACIÓN EN LA NUBE CON KUBERNETES

ALVARO REVUELTA

# WHO AM I?

Alvaro Revuelta.

- Alumni from this faculty - ETSIINF-UPM.
- working and living in Sweden.
- Working as a developer (Backend) in SciLifeLab.

# SCILIFELAB

Laboratory for Life Sciences.

1. Data Centre - Focus on the development of IT solutions on behalf of research and innovation.
2. DDS - Data Delivery System - System for secure delivering of data (incl. sensitive) to researchers
3. All the projects are Open Source.

# ESTRUCTURA

1. Introduction.
2. Orchestration in Kubernetes.
3. DevOps & GitOps.
4. Security in DDS.
5. Other projects in SciLifeLab.
6. Final - Questions.

# 1. INTRODUCTION - DATA DELIVERY SYSTEM

- The data is always kept on Sweden.
- The system has built-in encryption and key management.
- NOT a storage solution.

# 1. INTRODUCTION - CONTAINERS

(a) image

# 1. INTRODUCTION - KUBERNETES

- Orchestration and management of containers.
- Declarative language (YAML files).

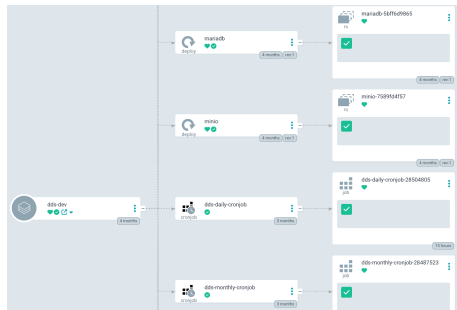

## 2. ORCHESTRATION IN KUBERNETES

- **ArgoCD** is used as a GitOps tool for CD of K8s applications.
- It is connected to a repository (GitHub) and for each change, all the required resources are updated **automatically**.
- Motorization of alerts and errors with **OpenSearch** and resources with **Grafana**.

## 2. - ORCHESTRATION IN KUBERNETES

adapt cronjobs to latest changes in flask commands #61

Merged valyo merged 2 commits into main from redplay-dts-backed on Dec 18, 2023

### 3. DEVOPS & GITOPS

- Branching Strategy: For every change, new **Branch** and **Pull Request (PR)**
- GitHub Actions: Automatic testing.
- You work on this new branch, which will be **deleted** after merge.

#### Read this before submitting the PR

1. Always create a Draft PR first.
2. Go through sections 1-5 below, fill them in and check all the boxes
3. Make sure that the branch is updated; if there's an "Update branch" button at the bottom of the PR, rebase or update branch.
4. When all boxes are checked, information is filled in, and the branch is updated: mark as Ready For Review and tag reviewers (top right)
5. Once there is a submitted review, implement the suggestions (if reasonable, otherwise discuss) and request a new review.

If there is a field which you are unsure about, enter the edit mode of this description or go to the [PR template](#); There are invisible comments providing descriptions which may be of help.

#### 1. Description / Summary

Changes in the registration to add acceptance of the newly created user agreement

#### 2. Jira task / GitHub issue

[Link to the github issue or add the Jira task ID here.](#)

#### 3. Type of change

What type of change(s) does the PR contain?

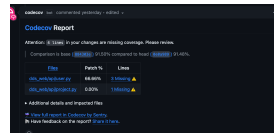

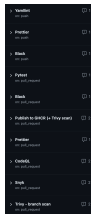

Check the relevant boxes below. For an explanation of the different sections, enter edit mode of this PR description template.

- ☒ New feature  
☐ Breaking: Why / How? Add info here.  
☒ Non-breaking

### 3. DEVOPS & GITOPS

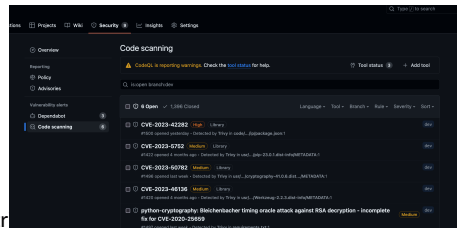

- For every PR, a new suite of tests will be executed.
- If any of them fails, the PR will be **blocked**.

### 3. DEVOPS & GITOPS

- Some actions will only be executed **after** merging. Some of them will continously scan for **security vulnerabilities**.
- At the last stage, a new image with the specified tag will be publish on **Docker Hub**.  
See  
`dds_web/blob/dev/.github/workflows/publish_and_tr`

## SUMMARY SO FAR

Two repositories:

1. The main one, where the app code lives, it publishes the images with the dockerized application.
2. A second one connected with ArgoCD with contains the YAML for Kubernetes.

## 4. SECURITY AND CIPHERS

- Public-private key for each user, the private key is further ciphered with the password.
- When a new project is created, another key pair is generated. The project private key is then ciphered with the user public key.
- Therefore, the project private key can only be deciphered with the user private key, which is obtained through the user password.

## 4. SECURITY AND CIPHERS.

- For the project keys, the algorithm used is **X25519** Diffie Helman Elliptic Curve - "Crypthography" Python package.  
Link
- The subsequent cipher of the private key is done with RSA.  
Link.

```
def generate_project_key_pair(user, project):
    private_key = asymmetric.x25519.X25519PrivateKey.generate()
    private_key_bytes = private_key.private_bytes(
        encoding=serialization.Encoding.Raw,
        format=serialization.PrivateFormat.Raw,
        encryption_algorithm=serialization.NoEncryption(),
    )
    public_key_bytes = private_key.public_key().public_bytes(
        encoding=serialization.Encoding.Raw,
        format=serialization.PublicFormat.Raw,
    )
    project.public_key = public_key_bytes
    for unit_user in user.unit.users:
        _init_and_append_project_user_key(unit_user, project, private_key_bytes)
    del private_key_bytes
    del private_key
    gc.collect()
```

## 4. SECURITY AND CIPHERS.

- To access the application a **temporal token** has to be generated with **2FA**.
- First, the user sends their username and password. Then a code is sent to the email or authenticator app. Finally, a new token with a limited duration is created.
- In this case it is a **JWT** (JSON Web Token).
- The data is ciphered with the algorithm **ChaCha20-Poly1305**  
<https://datatracker.ietf.org/doc/html/rfc7539>
